Weather App

Three Views have been made for this app. The first view is the place where a user can enter a location and then click on the button below to check complete weather report. Then other view shows the weather data i.e. current weather summary followed by weather forecast. And the last view shows the detailed weather data for the forecast or current weather, whatever the user has clicked in the previous view.

As can be seen in the output on the right hand side, url corresponding to city is being extracted dynamically from DICTIONARY made using csv.
